

What is project dependencies?

Project dependencies refer to the external components, libraries, or frameworks that a project requires to function correctly. These dependencies can include various types of software, such as:

Libraries: Pre-written code that a project uses to implement specific functionalities, such as data manipulation or network communication.

Frameworks: Structures that provide a foundation on which software can be developed, offering predefined functions and structures.

External Services: APIs or other web services that the project interacts with to retrieve or send data.

Plugins: Extensions that add specific features or functionalities to the software.

Tools: Software tools required for development, testing, building, or deploying the project.
